(i) A Voltage Source shift (E-Shift)
(ii) A Current " " (I- ") $I \to 0 \Rightarrow O/C$. $V \to 0 \Rightarrow S/C$.

$$\frac{V_y - K}{3}$$

$$V_x - 6 + \frac{V_x}{2} + \frac{V_x}{4} = 0$$

$$V_x = 3.42\,V$$

$$+2 = \frac{V_y - KV_x}{3} + \frac{V_y - V_x}{2}$$

$$2 = \frac{-K(3.42)}{3} - \frac{3.42}{2}$$

$$K = -3.25\,V$$

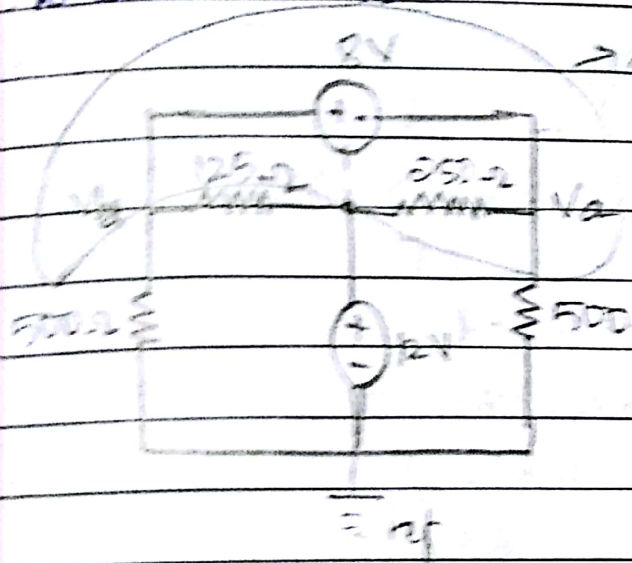
Supernode analysis: [Dependent Voltage Source]

When network has an ideal voltage source as one of its branches then the current through this voltage source cannot be determined and it should be noted that this V.S is present b/w 2 nodes hence these two nodes can be considered as one node which is called as super node using this Supernode w.r.t. KCL eq's can be reduced by 1

[We note that this ideal source must be b/w non-ref nodes. Then only supernode can be considered.]

Ex: Determine V_o



→ supernode

$\frac{V_1-0}{3} + \frac{V_1}{8} = 3$

$\frac{V_1}{3} - 4 + \frac{V_1}{8} = 3$

$V_o = 0$

$V_b - V_a = 8$

$V_b = 8 + V_a$

Applying KCL at supernode.

$$\frac{V_b}{500} + \frac{V_b - 12}{125} + \frac{V_a}{500} + \frac{V_a - 12}{250} = 0$$

$$\frac{8+V_a}{500} + \frac{8+V_a-12}{125} + \frac{V_a}{500} + \frac{V_a-12}{250} = 0$$

$$\frac{8}{500} + \frac{V_a}{500} - \frac{4}{125} + \frac{V_a}{125} + \frac{V_a}{500} + \frac{V_a}{250} - \frac{12}{250} = 0$$

$$V_a\left[\frac{1}{500} + \frac{1}{125} + \frac{1}{500} + \frac{1}{250}\right] = \frac{4}{125} + \frac{12}{250} - \frac{8}{500}$$

$V_a(0.016) = 0.064$

$\boxed{V_a = 4V}$

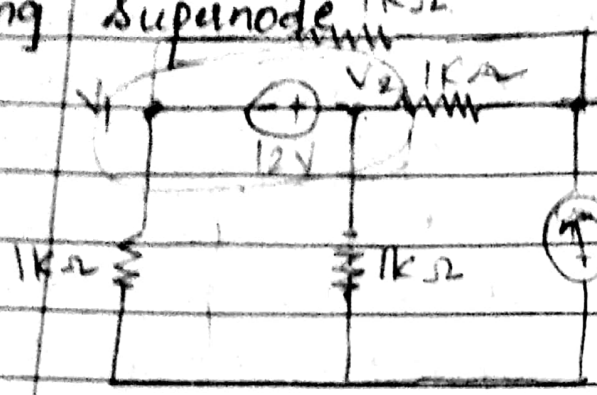
Using Supernode



$-V_1 + V_2 = 12$

$V_2 = 12 + V_1$

$$\frac{V_1}{1^K} + \frac{V_1 - V_3}{1^K} + \frac{V_2}{1^K} + \frac{V_2 - V_3}{1^K} = 0$$

$$V_1 + V_1 - V_3 + V_2 + V_2 - V_3 = 0$$

$$2V_1 + 2V_2 - 2V_3 = 0$$

$$V_1 + V_2 - V_3 = 0$$

$$V_1 + 12 + V_1 = V_3$$

$$2V_1 + 12 = V_3$$

$$\frac{V_3 - V_2}{10^3} + \frac{V_3 - V_1}{10^3} = 2 \times 10^{-3}$$

$$2V_2 - V_2 - V_1 = 2 \times 10^{-3} \times 10^3$$

$$2(2V_1 + 12) - 12 - V_1 - V_1 = 2$$

$$2V_1 + 12 = 2$$
